#### **NEW QUESTION: 1**

What is a cause for unicast flooding?

**A.** A man-in-the-middle attack can cause the ARP cache of an end host to have the wrong MAC address. Instead of having the MAC address of the default gateway, it has a MAC address of the man-in-the-middle. This causes all traffic to be unicast flooded through the man-in-the-middle, which can then sniff all packets.

**B.** Forwarding table overflow prevents new MAC addresses from being learned, and packets destined to those MAC addresses are flooded until space becomes available in the forwarding table.

**C.** When PIM snooping is not enabled, unicast flooding occurs on the switch that interconnects the PIM-enabled routers.

**D.** Unicast flooding occurs when multicast traffic arrives on a Layer 2 switch that has directly connected multicast receivers.

**Answer: B**

## **NEW QUESTION: 2**

Scenario

Refer to the topology. Your company has decided to connect the main office with three other remote branch offices using point-to-point serial links.

You are required to troubleshoot and resolve OSPF neighbor adjacency issues between the main office and the routers located in the remote branch offices.

Use appropriate show commands to troubleshoot the issues and answer all four questions.

Instructions

An OSPF neighbor adjacency is not formed between R3 in the main office and R5 in the Branch2 office.

What is causing the problem?

**A.** There is an area ID mismatch.

**B.** There is a missing network command in the OSPF process on R5.

**C.** There is a PPP authentication issue; a password mismatch.

**D.** There is an OSPF hello and dead interval mismatch.

**Answer: D**

Explanation:

Explanation/Reference:

Explanation:

Here are the relevant parts of the router configs:

Continue checking their connected interfaces with the "show running-config" command:

The only difference we can see here is the line "ip ospf hello-interval 50" on R3. This command sets the number of seconds R3 waits before sending the next hello packet out this interface. In this case after configuring this command, R3 will send hello packets to R5 every 50 seconds. But the default value of hello-interval is 10 seconds and R5 is using it. Therefore we can think of a hello interval mismatch problem here. You can verify with the "show ip ospf interface

<interface>" command on each router.

So we can see both hello and dead interval are mismatched because the dead interval always four times the value of hello interval, unless you manually configure the dead interval (with the ip ospf dead-interval <seconds> command).
