Answer: A
Explanation:
The IAM Role must be fine, as if it were broken, NO jobs would
be processed since the system would never be able to get any
queue messages. The same reasoning applies to the routing table

change. The scaling metric is fine, as instance count increased when the queue depth increased due to more messages entering than exiting. Thus, the only reasonable option is that some of the recent messages must be malformed and unprocessable.

NEW QUESTION: 4
DRAG DROP
You manage an Azure Web Site in Standard mode at the following address: contoso.azurewebsites.net.
Your company has a new domain for the site that needs to be accessible by Secure Socket Layer (SSL) encryption.
You need to be able to add a custom domain to the Azure Web Site and assign an SSL certificate.
Which three steps should you perform next in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order. More than one order of answer choices may be correct. You will receive credit for any of the correct orders you select

Answer:
Explanation:

Explanation

First create a CNAME record, then to add the domain name as a custom domain and last add the SNI SSL binding. The advantage of using a CNAME record and a SNI SSL binding is that it does not matter if the IP address of the website changes.
