NEW QUESTION: 2
A company builds an application to allow developers to share
and compare code. The conversations, code snippets, and links
shared by people in the application are stored in a Microsoft
Azure SQL Database instance. The application allows for
searches of historical conversations and code snippets.
When users share code snippets, the code snippet is compared
against previously share code snippets by using a combination
of Transact-SQL functions including SUBSTRING, FIRST_VALUE, and
SQRT. If a match is found, a link to the match is added to the
conversation.
Customers report the following issues:
* Delays occur during live conversations
* A delay occurs before matching links appear after code
snippets are added to conversations
You need to resolve the performance issues.
Which technologies should you use? To answer, drag the
appropriate technologies to the correct issues. Each technology
may be used once, more than once, or not at all. You may need
to drag the split bar between panes or scroll to view content.
NOTE: Each correct selection is worth one point.

Answer:
Explanation:

Explanation:
Box 1: memory-optimized table
In-Memory OLTP can provide great performance benefits for
transaction processing, data ingestion, and transient data
scenarios.
Box 2: materialized view
To support efficient querying, a common solution is to
generate, in advance, a view that materializes the data in a
format suited to the required results set. The Materialized
View pattern describes generating prepopulated views of data in
environments where the source data isn't in a suitable format
for querying, where generating a suitable query is difficult,
or where query performance is poor due to the nature of the
data or the data store.
These materialized views, which only contain data required by a
query, allow applications to quickly obtain the information
they need. In addition to joining tables or combining data

entities, materialized views can include the current values of
calculated columns or data items, the results of combining
values or executing transformations on the data items, and
values specified as part of the query. A materialized view can
even be optimized for just a single query.
