NEW QUESTION: 3

Which two statements are valid for Call Re-establishment in WCDMA? (Choose two.)

- A.** Call Re-establishment in WCDMA targets RL failures or RLC errors in the DL.
- B.** When Call Re-establishment in WCDMA is activated and after RL failure or an RLC unrecoverable error, the UE goes to idle mode.
- C.** Call Re-establishment in WCDMA improves the voice drop rate.
- D.** When Call Re-establishment in WCDMA is activated and after RL failure or an RLC unrecoverable error, the UE selects a new cell using the soft handover procedure.

Answer: C,D

NEW QUESTION: 4

A security administrator must implement a system to allow clients to securely negotiate encryption keys with the company's server over a public unencrypted communication channel.

Which of the following implements the required secure key negotiation? (Choose two.)

- A.** PBKDF2
- B.** Steganography
- C.** Diffie-Hellman

D. ECDHE

E. Symmetric encryption

Answer: C,D

Explanation:

Section: Cryptography

Explanation/Reference:

Explanation:

Elliptic curve Diffie-Hellman (ECDH) is an anonymous key agreement protocol that allows two parties, each having an elliptic curve public-private key pair, to establish a shared secret over an insecure channel.

This shared secret may be directly used as a key, or better yet, to derive another key which can then be used to encrypt subsequent communications using a symmetric key cipher. It is a variant of the Diffie-Hellman protocol using elliptic curve cryptography.

Note: Adding an ephemeral key to Diffie-Hellman turns it into DHE (which, despite the order of the acronym, stands for Ephemeral Diffie-Hellman).

Adding an ephemeral key to Elliptic Curve Diffie-Hellman turns it into ECDHE (again, overlook the order of the acronym letters; it is called Ephemeral Elliptic Curve Diffie-Hellman). It is the ephemeral component of each of these that provides the perfect forward secrecy.
