Cisco Network-Based Intrusion Detection-Functionalities and Configuration This chapter highlights the need for and the benefits of deploying network-based intrusion detection in the data center. It addresses mitigation techniques, deployment models, and the management of the infrastructure. Intrusion detection systems help data centers and other computer installations prepare for and deal with electronic attacks. Usually deployed as a component of a security infrastructure with a set of security policies for a larger, comprehensive information system, the detection systems themselves are of two main types. Network-based systems inspect traffic "on the wire" and host-based systems monitor only individual computer server traffic. Network intrusion detection systems deployed at several points within a single network topology, together with host-based intrusion detection systems and firewalls, can provide a solid, multi-pronged defense against both outside, Internet-based attacks, and internal threats, including network misconfiguration, misuse, or negligent practices. The Cisco Intrusion Detection System (IDS) product line provides flexible solutions for data center security.
