What is the command that will extract information, such as module parameters, from the Linux Kernel modules and print this information to the command line? (Please specify only the command with no path information)

Answer:

Explanation:

modinfo

Explanation:

from the man pages:

modinfo -- program to show information about a Linux Kernel module

modinfo by default lists each attribute of the module in form fieldname : value, for easy reading.

The filename is listed the same way (although it's not really an attribute).
