NEW QUESTION: 1
You have an Exchange Server 2013 organization that contains two servers. The servers are configured as shown in the following table.

EX1 and EX2 are members of a database availability group (DAG) named DAG1.
You have a database named DB1 that replicates to EX1 and EX2.
EX1 fails.
You discover that DB1 does not mount on EX2.
You view the status of the mailbox databases as shown in the following table.

You need to ensure that the database attempts to mount on EX2
if EX1 fails.
What should you change?
A. The AutoDatabaseMountDial setting to Lossless
B. The activation preference of DB1\EX1
C. The activation preference of DB1\EX2
D. The AutoDatabaseMountDial setting to BestAvailabilty
Answer: D
Explanation:
* The MailboxServer.AutoDatabaseMountDial property gets or sets
the automatic database mount behavior for an Exchange server
that is running the Mailbox server role in a continuous
replication environment after a database failover.
*The AutoDatabaseMountDial property specifies the automatic
database mount behavior of a Mailbox server after a failover.
Each behavior is based on the copy queue length, or the number
of logs that are recognized by the passive copy that need to be
replicated. If the copy queue length is greater than the value
specified for the behavior, the database does not automatically
mount. If the copy queue length is less than or equal to the
value
specified for the behavior, the Mailbox server tries to copy
the remaining logs to the passive copy and mounts the database.
*BestAvailability The database automatically mounts immediately
after a failover if the queue length is less than or equal to
12.
Incorrect: Not A: Lossless The database does not automatically
mount until all logs generated on the active device are copied
to the passive device
