NEW QUESTION: 1
A user has two EC2 instances running in two separate regions. The user is running an internal memory management tool, which captures the data and sends it to CloudWatch in US East, using a CLI with the same namespace and metric. Which of the below mentioned options is true with respect to the above statement?
A. CloudWatch will take the data of the server, which sends the data first
B. CloudWatch will receive and aggregate the data based on the namespace and metric
C. CloudWatch will give an error since the data will conflict due to two sources
D. The setup will not work as CloudWatch cannot receive data across regions
Answer: B
Explanation:
Explanation/Reference:
Explanation:
Amazon CloudWatch does not differentiate the source of a metric when receiving custom data. If the user is publishing a metric

with the same namespace and dimensions from different sources, CloudWatch will treat them as a single metric. If the data is coming with the same timezone within a minute, CloudWatch will aggregate the data. It treats these as a single metric, allowing the user to get the statistics, such as minimum, maximum, average, and the sum of all across all servers.
