NEW QUESTION: 1

You are developing an ASP.NET MVC application.

The application must allow users to enter JavaScript in a feedback text box only.

You need to disable request validation.

What should you do?

- A.** Apply and set the ValidateInput attribute on the text box to FALSE.
- B.** Use the HttpRequest.Form property to read the unvalidated form value.
- C.** Apply and set the CausesClientSideValidation attribute on the text box to FALSE.
- D.** Use the HttpRequest.Unvalidated property to read the unvalidated form value.

Answer: D

Explanation:

Explanation

The `HttpRequest.Unvalidated` property gets the HTTP request values without triggering request validation.

Request validation checks for HTML markup and script that might indicate a potential cross-site scripting attack. By default, all values are checked using request validation and if any values contain markup or script, ASP.NET throws an `HttpRequestValidationException` exception. Use this method if you anticipate that the request will contain markup (for example, you are allowing users to post content that contains markup) and you want to get the raw value of a request.

NEW QUESTION: 2

Click the Exhibit button.

A storage administrator has an existing FAS2554 HA pair. They want to add a new FAS2620 HA pair to the cluster. The SAN protocols are licensed.

Referring to the exhibit, after adding the second HA pair, how many more nodes are available to add for future use?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: A

NEW QUESTION: 3

SNMP is a protocol used to query hosts, servers, and devices about performance or health

status data. This protocol has long been used by hackers to gather great amount of information about remote hosts.

Which of the following features makes this possible? (Choose two)

- A. It used TCP as the underlying protocol.
- B. It is susceptible to sniffing.
- C. It is used by all network devices on the market.
- D. It uses community string that is transmitted in clear text.

Answer: C,D

Explanation:

Simple Network Management Protocol (SNMP) is a protocol which can be used by administrators to remotely manage a computer or network device. There are typically 2 modes of remote SNMP monitoring. These modes are roughly 'READ' and 'WRITE' (or PUBLIC and PRIVATE). If an attacker is able to guess a PUBLIC community string, they would be able to read SNMP data (depending on which MIBs are installed) from the remote device.

This information might include system time, IP addresses, interfaces, processes running, etc. Version 1 of SNMP has been criticized for its poor security. Authentication of clients is performed only by a "community string", in effect a type of password, which is transmitted in cleartext.
