NEW QUESTION: 3
You are using a configuration management system to manage your
Amazon EC2 instances. On your Amazon EC2 Instances, you want to
store credentials for connecting to an Amazon RDS MYSQL DB
instance. How should you securely store these credentials?
A. Store the Amazon RDS DB credentials in Amazon EC2 user data.
Import the credentials into the Instance on boot.
B. Assign an 1AM role to your Amazon EC2 instance, and use this
1AM role to access the Amazon RDS DB from your Amazon EC2
instances.
C. Give the Amazon EC2 instances an 1AM role that allows read
access to a private Amazon S3 bucket.
Store a file with database credentials in the Amazon S3 bucket.
Have your configuration management system pull the file from
the bucket when it is needed.
D. Launch an Amazon EC2 instance and use the configuration
management system to bootstrap the instance with the Amazon RDS
DB credentials. Create an AMI from this instance.
Answer: B
Explanation:
Explanation
Creating and Using an 1AM Policy for 1AM Database Access
To allow an 1AM user or role to connect to your DB instance or
DB cluster, you must create an 1AM policy.
After that you attach the policy to an 1AM user or role.
Note
To learn more about 1AM policies, see Authentication and Access
Control for Amazon RDS.
The following example policy allows an 1AM user to connect to a
DB instance using 1AM database authentication.

Important
Don't confuse the rds-db: prefix with other Amazon RDS action
prefixes that begin with rds:. You use the rds-db: prefix and
the rds-db:connect action only for 1AM database authentication.
They aren't valid in any other context.
1AM Database Authentication for MySQL and Amazon Aurora
With Amazon RDS for MySQL or Aurora with MySQL compatibility,
you can authenticate to your DB instance or DB cluster using
AWS Identity and Access Management (IAMJ database
authentication. With this authentication method, you don't need
to use a password when you connect to a DB instance. Instead,
you use an authentication token.
An authentication token is a unique string of characters that
Amazon RDS generates on request.
Authentication tokens are generated using AWS Signature Version
4. Each token has a lifetime of 15 minutes.
You don't need to store user credentials in the database,
because authentication is managed externally using
1AM. You can also still use standard database authentication.
IAM database authentication provides the following benefits:
* Network traffic to and from the database is encrypted using
Secure Sockets Layer (SSL).
* You can use IAM to centrally manage access to your database
resources, instead of managing access individually on each DB
instance or DB cluster.
* For applications running on Amazon EC2, you can use EC2
instance profile credentials to access the database instead of
a password, for greater security.

.lAMPolicy.htm You can use roles to delegate access to users,
applications, or services that don't normally have access to
your AWS resources. For example, you might want to grant users
in your AWS account access to resources they don't usually
have, or grant users in one AWS account access to resources in
another account. Or you might want to allow a mobile app to use
AWS resources, but not want to embed AWS keys within the app
(where they can be difficult to rotate and where users can
potentially extract them). Sometimes you want to give AWS
access to users who already have identities defined outside of
AWS, such as in your corporate directory. Or, you might want to
grant access to your account to third parties so that they can
perform an audit on your resources. For more information on 1AM
Roles, please refer to the below document link: from AWS
