NEW QUESTION: 2

You manage an Azure web app in standard service tier at the following address: `contoso.azurewebsites.net`. Your company has a new domain for the site named `www.contoso.com` that must be accessible by secure socket layer (SSL) encryption.

You need to add a custom domain to the Azure web app and assign an SSL certificate.

Which three actions should you perform? Each correct answer presents part of the solution.

A. Create a new file that will redirect the site to the new URL and upload it to the Azure Web site.

B. Add SSL binding for the `www.contosco.com` domain with the IP-based SSL option selected.

C. Add `www.contoso.com` to the list of domain names as a custom domain.

D. Add SSL binding for the `www.contoso.com` domain with the server Name indication (SNL) SSL option selected.

E. Create a CNAME record from `www.contoso.com` to `contoso.azurewebsites.net`.

Answer: A,B,E

Explanation:

Explanation

Step 1: When adding a CNAME record, you must set the Host Name field to the sub-domain you wish to use.

For example, `www`. You must set the Address field to the `.azurewebsites.net` domain name of your Azure Website. For example, `contoso.azurewebsites.net`.

* Step 2: Modify the service definition and configuration files. Your application must be configured to use the certificate, and an HTTPS endpoint must be added. As a result, the service definition and service configuration files need to be updated.

* Step 3:

IP based SSL associates a certificate with a domain name by mapping the dedicated public IP address of the server to the domain name. This requires each domain name (`contoso.com`, `fabricam.com`, etc.) associated with your service to have a dedicated IP address. This is the traditional method of associating SSL certificates with a web server.
